(Pocket-lint) - Now in its fifth iteration, the Apple Watch has gone from strength to strength since its launch, adding new features and refining those features if possible. In 2018, we've seen a huge change in what the Apple Watch has to offer. Whether it's an easy-to-use fitness app, the ability to stream music directly to AirPods, AirPods Pro, or Bluetooth, or using your Apple Watch to pay for things with Apple Pay when you're on the go, there's a lot of advice. Heart rate monitor is one of the best on the ECG market and crash detection stuff saves lives, and even features like breathe app allows users to just slow down and take things with a breath. To say it's a game changer for many is probably an under appreciate. With such tremendous momentum, where does Apple go next to keep up the pace of change in goal? The answer is the Apple Watch Series 5, which brings new features like always on display and a digital compass. But is it enough to make you want to upgrade or dive for the first time? Titanium and ceramic options added new Hermes and Nike models still available in the 40mm and 44mm sizes apple watch series 5 design has not changed. It's still the same as the Series 4, which means it still comes in two sizes - 40mm and 44mm - offering a digital crown and touchscreen to control everything, and is very focused on health and getting messages when on the go without looking at your iPhone. Pocket-lint Nam could be the same as last year, but this time it will come in many different materials, two of which will be brand new for this device. Materials to choose from now include aluminum, stainless steel, titanium and ceramics - and apple also offers a variety of colours and finishes within these material options. The titanium model comes in two colors: silver - which shows off metal in a more natural light - and a space black titanium that gives the watch a very masculine and edgy sense of action. The titanium model is approximately 13% lighter, not that you'd notice, and for those who geek out about these things, it might be even easier because of the strength of the material, but that would mean changing the layout of the insides, but that would mean changing the production line to accommodate it. 1/7 Pocket-lint Ceramic version - which is a return to the material on the Apple Watch - is only available in white, but the polished finish is perhaps the most desirable of the lot. It's also the most expensive. In addition to the new case materials, Apple has also introduced the new Hermes and Nike Watch versions of series 5, and again these are designed to appeal to a certain audience. They have the same technical specifications and design, but are tailored to the respective brands with dedicated straps, watches and prices to match. If you liked the look and feel of your Apple Watch Series 4, you'll like apple watch series 5. We've been wearing Series 4 since his in 2018 and the larger display works really well, allowing you to see a lot more information at a glance without being too cumbersome on your wrist. Pocket-lint Series 5 continues that with the selection of new materials that, if you have a budget, will appeal to many. Another good news is that straps from previous models will still fit the new watch so that watch owners can bring those to the party. Perhaps it is worth noting that the entry-level watch does not use sapphire glass, and therefore may over time be prone to picking up scratches from punches and bashes. If you can afford to get the stainless steel version, the glass is much thicker and therefore more durable. The overall design hasn't changed, but the OLED screen feature has, and the Apple Watch Series 5 includes the feature we've asked for from the start - always on display, so you can look at your watch just like an analog watch or most other smartwatches. Pocket-lint Rather how to go black when not active, as it has been since the first Apple Watch, the watch now slightly dims, allowing you to save battery, but still see the information on the screen. The difference is stark, especially if you are one of those people who likes to keep an eye on time without having to vigorously move your wrist every time you want to do so. Whether your screen is on or off on a high-contrast screen that displays these vibrant colors, whether it's your exercise rings or a message from a friend. We've also found that crazy wrist movie that you see Apple Watch owners do, and means that on the run when you lift your hand the screen is on ready for you to read without delay. Many of the watch's faces change color when they're not active, to save battery power and make it easier to see at a glance. The new California watch face goes from colored face to black and white for example Mickey all but disappears apart from his hands, while others lose other elements accordingly. Of course, you can turn off the always-on feature. Understanding that some complications offer sensitive data, there is a setting that can be hidden when the screen is not active, so do not reveal appointments in the calendar to everyone on different. Pocket-lint As apple, the feature will not affect battery life, but of course it does. Apple Watch Series 4 keeps giving us a good day and half the battery life from 2018. Apple Watch Series 5 only finishes us at the end of the day (about 18 hours). That's disappointing, but still in keeping with Apple's promises. But be ware: if you forget to charge it overnight you won't be making it up the next day as you previously could. Some of them come to have vivid and glorious views and from bump to size on Series 4, there are few watches that can really compare to the quality of the display - even if that's what it put into the battery. What is also interesting is that because always on we found ourselves opting for more analog face watches. It's unofficial, but we found the watch's hands easier to read at a glance when the display is muted. Digital compass It will work with third-party apps The only real novelty that's being written home in apple watch series 5 is the addition of a digital compass. There is a digital compass app for those orienteering moments when using Apple maps while walking or seeing how high that run actually took you. Pocket-lint Application of the compass will be able to record and display headings, slope, latitude, longitude and current altitude. Where it's most likely going to be used, you can see which direction you're looking at when looking at the maps app. This could only save you walking down the wrong street, or taking the wrong turn - which is probably the most consumer facing way to see it in action. We're yet to see how the feature will be implemented by other developers, and for months we haven't seen any that have made a big deal to support the compass, and at the moment it's very nice rather than something you use daily. Almost the same as the Model Series 4 Series 5 is identical to series 4, which has been on sale for the past year, in addition to the always-on display and digital compass. The new Apple Watch will come with the same S4 processor, the same battery, and the same W1 chip to connect to your iPhone and headphones, such as AirPods or Beats PowerBeats. It also has the same wireless charging feature as the Apple watch in front of it. Internally the 5 series has changed slightly to make way for a new compass. Surprisingly, given Apple's quiet push to include the U1 chip in the new iPhone 11 models, that chip hasn't made it into the Apple Watch, maybe the Apple Watch Series 6? Pocket-lint As previously watch features the ability to make and receive calls. Series 5 still retains this feature along with Walkie-Talkie mode, but passengers will be disappointed that while Apple has added an international emergency call for the mobile model that allows you to call local emergency services in more than 150 countries, it won't add roaming for regular calls. This is a frustrating omission for passengers and one we expected this time. Elsewhere, series 5 continues the good work of series 4: the heart rate monitor is incredibly accurate, which means you still have access to a range of metrics, while GPS does a solid job of tracking your location, so your Apple Watch rotates your hand to make it a fitness tracker or running watch if you want. There is no support for sleep monitoring - perhaps a strange omission, as is common on other devices - but it remains elusive. The new Noise Cycle tracking app for women New Watch faces WatchOS 6 adds new faces like California and Numerals Duo, which we like very much, as well as some new apps and features, including the app store, so you can search for apps on your watch itself, rather than iPhone in hand. Pocket-lint On Health Side WatchOS 6 brings a tracking cycle for women, and a new noise app that lets you see how loud your environment is. Noise is an interesting application that surprisingly appears here and there if you are in a loud environment. We were seen alerting us when we listened to loud music in the car or at night in a busy restaurant. While the situations we were in were more oh moments, the consequences for those in constantly noisy environments could be really beneficial. This is Apple continuing to push health as the number one feature of the Apple Watch. Activity trends are also available, so you can see how your activity metrics are trending over an extended period of time, and there's even a Calculator app for this nostalgic 1980s return moment, or more likely to work on how to spill an account and what tip you should give. All of the Features of WatchOS 6 are available on older devices, taking away some of the need for innovation, especially if you think all of the above are available on the now incredibly cheap Apple Watch Series 3 for just \$199/£199. Our favorite software feature, if you own a MacBook, is that you can use your watch to unlock your PC or access locked notes. It's a small property, but one that we use several times a day, and that's a big difference. The best Apple Watch apps 2020: 45 apps to download that really deliver the Verdict With so many big advances in 2018, the Apple Watch Series 5 seems to be perfecting and improving the experience we've seen with the Apple Watch Series 4 - which is no longer on sale. The changes, while welcomed, are relatively small this time suggesting that Apple is putting the brakes on to avoid adding too many features too quickly. Of course, there are many that could still add or improve. A better battery now screen is always-on, sleep tracking, and better wireless charging without having to take charging the puck with your wherever you go, there are a few features that spring in mind. As an upgrade from the series 4 is certainly not necessary. The always-on screen is beautiful, and now we've started using it, we'd be trying to come back, but if you haven't experienced it yet, you really don't need it. But for Watch Series 3 or older owners, the combination of larger screens, enhanced features and WatchOS 6 make this a brilliant smartwatch upgrade, then wear and enjoy. Apple's smartwatch is still the one to beat, but this year Apple is taking things a little easy when it comes to new innovations and features. This article was first published on March 10, 2015. Pocket-lint squirrel_widget_145363 No, we're not trolling you, the Samsung watch works with iOS. That said, even though it's a great watch - it looks like one, rather than a smart device - it has limited compatibility with Apple and, frankly, the larger screen of the S4 watch is much more appealing. Samsung Check out the Pocket-lint squirrel_widget_148296 If you're not forced into a larger 5 Series display, there's nothing to stop you from getting over the 3 Series. Thanks to the upgraded watchOS has most of the same features and is now available at a great price. What is Pocket-lint daily and how do you get it for free?
